MP10 centers, neighborhoods and formal fronts

63 sections | 265,002 tissue spots | 143,461 frozen Epi queries

57 primary programs + 23 sensitivity programs; original Top20 AUCell unchanged.

5,664 P95 tumor-Epi reference points; 1,979 exact-front-position matched pairs.

R0: modest stress/growth associations; shared-gene removal attenuates several signals.

Androgen and TGF-beta associations largely disappear without MP10 overlap genes.

p-EMT is modestly lower at MP10-high centers; spatial effects weaken with distance.

No consistent global p-EMT / Flores increase at the formal v3.4 front.

No robust P95 front enrichment or MP10-specific R12 preference after family FDR.

Main repeated-unit summary: 54 units / 6 data sets; verified subset: 27 patients / 3 sets.

Normal-source samples and unverified identities remain separate.

All effects, uncertainty, coverage, negative findings and missing modules are retained.

Read summary.md and methods.md before biological interpretation.
PDF graphics are vector; H&E retains its original raster format.
